 Yan R., Rychlik W., Etchison D., Rhoads R.E.; "Amino acid sequence of the human protein synthesis initiation factor
 Mader S., Lee H., Pause A., Sonenberg N.;

"The translation initiation factor eIF-4E binds to a common motif
shared by the translation factor eIF-4 gamma and the translational
repressors 4E-binding proteins.";

Mol. Cell. Biol. 15:4990-4997(1995).

-! FUNCTION: COMPONENT OF THE PROPELEX EIF-4, WHICH IS
INVOLVED IN THE RECOGNITION OF THE MRNA CAP, ATP-DEPENDENT
UNAINDING OF 5'-TERMINAL SECONDARY STRUCTURE AND RECRUITMENT OF
MRNA TO THE RIBOSOME.

-!- PTH: PHOSPHORYLATED AT WULTIPLE SITES IN VIVO.

-! SIMILARITY: CONTAINS I RNA RECOGNITION MOTIF (RRM).

-! SIMILARITY: THE C-FERMINAL REGION IS SIMILAR TO THE N-TERMINAL
REGION OF WHEAT EUKARYOTIC INITIATION FACTOR (ISO)4F SUBUNIT P82.

- FUNCTION: GAP CLASS SEGMENTATION PROTEIN THAT CONTROLS DEVELOPMENT OF HEAD STRUCTURES.
 SUBCELLULAR LOCATION: NUCLEAR.

SUBCELLULAR LOCATION: NUCLEAR.

ISSUE SPECIFICITY: IN EMBRYO, EXPRESSION OF MATERNAL TRANSCRIPT
IS HIGHEST IN ANTERIOR REGION. EXCOTIC TRANSCRIPT IS EXPRESSED IN
ANTERIOR REGION UNTIL FREE MEDINING OF GASTRULATION AND IN
EXPRESSED IN DEVELOPING NERVOUS SYSTEM.

EXPRESSED IN DEVELOPING NERVOUS SYSTEM.

DEVELOPMENTAL STAGE: EXPRESSED MATERALLY AND ZYGOTICALLY

SERPESSION OF THE MATERNAL TRANSCRIPT DECREASES UNTIL EMBRYONIC
STAGE 14, ZYGOTIC TRANSCRIPT IS FIRST DETECTED AT STAGE 11.

SIMILARITY: BELONGS TO THE HUNCHBACK FAMILY OF C2H2-TYPE ZINC.
 SEQUENCE OF 281-349 FROM N-A.

MEDLINE-93066327; PubMed=1438276;

 Detection of modulators of Mena and Ena-VASP-like genes and proteins - used in control of cytoskeletal dynamic events in normal and abnormal cell morphology, adhesion, motility, growth and
 Mena protein; mammalian Ena; Enabled; Evl protein; cytoskeleton; cell morphology; cell adhesion; cell differentiation; cell growth; cell motility; mouse.
 This polypeptide comprises murine Mena (mammalian Ena) that shows significant amino acid similarity to Drosophila Ena and which exhibits a broad pattern of tissue distribution in neurons,

ŝ
 The present invention a method for detecting the presence or absence of mutations in the E-cadherin gene, which is indicative of a predisposition to cancer. The method can be used to identify predisposition to cancers such as breast cancer, colorectal cancer, pastric cancer, prostate cancer, thyroid cancer, kidney cancer, bladder cancer, and liver cancer. The method is particularly useful for identifying predisposition to rereditary diffuse gastric cancer (HDCC). Compounds which increase the expression or prevent the decrease of E-cadherin would be potential cancer chemopreventative agents. Gene therapy can also be used to supply wild-type E-cadherin. The key to cancer treatment is early detection.
an cDNA clone (T05764) derived from human liver. The extracellular domain of E-cadherin is used to generate peptides that specifically bind to heterotypic cognates of E-cadherin and which inhibit adhesion of intra-epithelial T-lymphocytes to E-cadherin-expressing epithelial or endothelial cells in vitro or in vivo, thereby modulating mucosal immune responses. Such peptides are also specifically reactive with a monoclonal antibody (E4.6 or E6.1) that binds to E-cadherin and that can inhibit T-cell binding.

The method allows the identification of individuals with a predisposition to cancer, particularly to hereditary cancer, which enables detection before the appearance of clinical symptoms, and thus allows treatment, or other courses of action, to commence as soon as possible. Also, families with histories of familial cancer will be able to undergo tests to search for E-cadherin gene mutations. The present sequence represents

 A37022 to A37144 encode the new isolated human transmcmbrane, receptor or secreted PRO polypeptides given in Y99340 to Y99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. A37145 to A37330 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
secreted PRO polypeptides, useful for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions
 E-cadherin is a cell adhesion molecule that is also known as uvomorulin, L-CAM and Cell CAM 120/80. The DNA encoding hEC was obtd. by screening normal human liver and hepatocellular carcinoma cDNA libraries and a colonic epithelial cell CDNA library. The following sequences are specifically claimed: AAS 1-878; 151-878; 30 sequential AAS from AAS 108-878; AAS 1-150; AAS 178-289; AAS 290-401; AAS 402-513; AAS 178-513; AAS 151-703; AAS 1-1703; AAS 728-878; AAS 704-878; nucleotide sequences comprising nucleotide numbers 116-2749; 566-2749; 1-1053; 10-26696; 1332-3000; 540-1500; 348-9066; 890-1648; 384-1208; 641-2046; 685-1336; 880-1661; 1199-1742; 1373-1742;

 This protein is encoded by gene 036 (see T91708), which was identified by differential display analysis as being expressed at a higher level in normal colon tissues than in cancerous colon tissues. Gene 036 is a candidate tumour suppressor gene. A correlation was found between an increase in the expression level of gene 036 and a decrease in a colon cell's tumour potential. Hence, methods that increase the level of expression of gene 036 may inhibit or slow the progression to tumours and cancer. e.g. colon cancer. The 036 protein is used in claimed methods for treating a patient suffering from a disorder associated with insufficient expression of gene 036 protein, and for identifying compounds that modulate 036 protein activity. Such compounds are useful in the diagnosis, prevention and treatment of tumours and

The present sequence represents the naturally-occuring wild-type platelet glycoprotein Ib alpha (GPIb alpha). The polypeptide can have a mutation which makes it more reactive with von Willebrand factor (WWF) chan the wild-type. Preferably the mutation is a substitution of within residues 228 to 238. The preferred mutation is a substitution of within residues 228 to 238. The preferred mutation a substitution of the wild-type Gly at position 233. The mutation a beta-bend conformation to an alpha helix conformation, and also creates an amphipathic region within the polypeptide. The DNA encoding mutant platelet GPIb alpha polypeptides (Where the mutation is between the patelet GPID alpha polypeptides (Where the mutation is between the useful for production of recombinant mutant GPIb alpha polypeptides, which can be used to inhibit platelet adhesion and aggregation (e.g. in anithrombotic medicaments or on medical devices or vascular prostheses), or can be labelled and used as imaging agents, or can be prosthese or thrombolytic agent for targeting to sites of thrombus or millaring an probes for diagnosis of platelet contact or anithrombolytic agent for targeting to sites of diagnosis of the platelet contact or an elementary and a probes for diagnosis of

 three-dimensional coordinates obtained from the crystals, is useful for identifying an agent that stabilizes the Ras-Sos complex. The crystals are also useful for identifying agents that inhibit the formation of Ras-Sos complex. Ras and Sos fragments are useful for growing a crystal of a protein-ligand complex. Agents that stabilize or inhibit the formation of Ras-Sos complex are useful in the treatment of cancer. The present sequence represents a Drosophila
 Gaps
 A substitution in platelet glycoprotein Ib alpha (Leucine 57 to Phenylalanine) underlies a form of Bernard-Soulier disease. The mutated glycoprotein can be used in compositions to inhibit platelet aggregation/adhesion. The glycoprotein may be labelled and agent, preferably tissue plasminogen activator (IPA), (PrO) urokinase, streptokinase, anisoylated plasminogen streptokinase activator complex, tPA analogues or a protease, allowing localisation of the thrombolytic agent to a thromboly.

Gaps
 A substitution in platelet glycoprotein ib alpha (Leucine 57 to Phenylalanine) underlies a form of Bernard-Soulier disease. The mutated glycoprotein can be used in compositions to inhibit platelet aggregation/adhesion. The glycoprotein may be labelled and used as an imaging agent and may also be bound to a thrombolytic agent, preferably tissue plasminogen activator (LPA), (PrO) urokinase, streptokinase, anisoylated plasminogen-streptokinase activator complex, tPA analogues or a protease, allowing localisation of the thrombolytic agent to a thrombus.
 Gaps

expressed in different cardiovascular disease states. Compositions which ear modify TGF-beta signalling pathway are identified by screening. These are used therapeutically to treat fibroproliferative and oncogenic disorders, especially TGF (Transforming growth factor)-beta related disorders, including diabetic retinopathy, artherosclerosis, pancreatic cancer, angiogenesis, inflammation, fibrosis, tumour growth and vascularisation. The present sequence is the protein product of fchd605 gene which is up-regulated in monocytes treated with oxidised LDL (low density lipoprotein) can be used to design cardiovascular disease treatment strategies. Depending on whether the up-regulation has a pathogenic or protective effect treatment methods can be designed to increase or decrease the activity of the protein product of the gene.
 Sos contacting region of a Ras protein and at least a Son of sevenless (Sos) protein catalytic region fragment, that effectively diffracts x-rays. Ras and Sos form a tight complex. Sos does not impede the binding sites for the nucleotide base and the ribose of GTP or GDP and thus the Ras-Sos complex maintains a structure that permits nucleotide release and rebinding. The crystals are used for the determination of the atomic coordinates of the complex to a resolution of more than 5.0 Angstrom. The crystals, or a dataset comprising the

 fchd605 gene; human; cardiovascular disease; oncogenic disorder; diabetic retinopathy: libroproliferative disorder; artherosclerosis; TGF-beta signalling pathway; TGF; Transforming growth factor; pancreatic cancer; anglogenesis; inflammation; fibrosis; tumour growth;
 symptoms of fibroproliferative
 This protein is encoded by the novel human fchd605 gene (see 794471) that is up-regulated in monocytes treated with oxidised low density lipoproteins that simulate the conditions under which foam cells develop during atherogenesis. The protein has sequence similarity to the mouse gly96 gene and to EST T49532. Novel fchd511, fchd540, fchd602 and fchd605 genes (see T94467-71) provide a fingerprint for the study of cardiovascular diseases, including atheroscierosis, ischaemia/reporfusion, hypertension, restenosis and arterial inflammation. Methods are provided for the diagnosis, monitoring in clinical trials, screening for therapeutically effective compounds, and treatment of cardiovascular diseases based on discoveries regarding the expression patterns of these novel genes.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

differentiation-dependent protein DIF-2 - human

C:Species: Homo sapiens (man) C:Date: 02-Sep-1997 #sequence\_revision 05-Sep-1997 #text\_change 07-May-1999

C. Accession: UC5537
R. Pietzsch, A.; Buechler, C.; Aslanidis, C.; Schmitz, G.
Blochem. Biophys. Res. Commun. 235, 4-9, 1997
A.Title: Identification and characterization of a novel monocyte/macrophage differ.
A.Reference number: UC5537; MUID:97339426
A.Molecule type: mRNA
A.Molecule type: mRNA
A.Residues: 1.156 < PIE>
A.Experimental source: monocyte
A.Note: the authors translated the codon CCG for residue 106 as Arg

 (pro) urokinase, streptokinase, anisoylated plasminogen-streptokinase activator complex, tPA analogues or a protease, allowing localisation of the thrombolytic agent to a thrombus.
three-dimensional coordinates obtained from the crystals, is useful for identifying an agent that stabilizes the Ras-Sos complex. The crystals are also useful for identifying agents that inhibit the formation of Ras-Sos complex. Rs and Sos fragments are useful for prowing a crystal of a protein-ligand complex. Agents that stabilize or inhibit the formation of Ras-Sos complex are useful in the treatment of cancer. The present sequence represents a Drosophila

ä
 This protein is encoded by gene 036 (see T91708), which was identified by differential display analysis as being expressed at a higher level in normal colon tissues than in cancercus colon tissues. Gene 036 is a candidate tumeur suppressor gene. A correlation was found between an increase in the expression level of gene 036 and a decrease in a colon cell's tumour potential. Hence, methods that increase the level of expression of gene 036 may inhibit or slow the progression to tumours and cancer, e.g. colon cancer. The 036 protein is used in claimed methods for treating a patient suffering from a disorder associated with insufficient expression of gene 036 protein, and for identifying compounds that modulate 036 protein activity. Such compounds are useful in the diagnosis, prevention and treatment of tumours and

of the alpha helix region and some of the proline-rich region, of pneumococcal surface protein A (PspA) of Streptococcus pneumoniae strain Rc123. Comparison of the N-reminal and central regions (W1453-57 and W14562-91) of PspA polypeptides from different pneumococcal strains can be used to divide the strains into several families based on sequence homologies. PspA polypeptides, or fragments of them can be used in vaccines to protect animals against S. pneumoniae infection and hence for the prevention of diseases such as otitis media, meningitis, bacteraemia and pneumonia. The sequence of the 3' half of the PspA alpha -halical region and the immediate 5' tip of the coding sequence are likely to be the critical sequences for predicting PspA cross-reactions and vaccine

 A37022 to A37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in Y99340 to Y99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. A37145 to A37330 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention.
secreted PRO polypeptides, useful for screening of potential peptide or
small molecule inhibitors of the relevant receptor/ligand interactions
 Gaps
 E-cadherin is a.cell adhesion molecule that is also known as uvomorulin, L-CAM and Cell CAM 120/80. The DNA encoding hEC was obtd. by screening normal human liver and hepatocellular carcinoma ciNA libraries and a colonic epithelial cell cDNA library. The following sequences are specifically claimed: AAS 1-878; 151-878; 30 sequential AAS from AAS 108-878; AAS 1-150; AAS 178-289; AAS 290-401; AAS 402-513; AAS 178-513; AAS 151-703; AAS 1703-788; 181-401; AAS 104-878; 1050-513; ABS 105-510; AAS 105

 haematopoletic ceils. Its amino acid sequence was deduced from a cDNA clone (see V02996) obtained from a mouse embryonic stem cell. CDNA library.

(EVI, see V02997), encoding novel proteins Mena and Ena-VASP-like (EVI, see V02997), encoding novel proteins Mena and EVI (see W37149) are disclosed. Mena and EVI proteins have a discrete, EVII functional domain responsible for Mena binding to Listerie, and to the cytoskeletal proteins 2yxin and vinculin. The EVII domain of Mena is also responsible and sufficient for targeting localisation of Mena and Mena-based fusion proteins to focal adhesions, and to the surface of Listeria cells at the polar site of induction of actin comet tail formation. Based on the disclosed Mena and EVI promation, a variety of methods and compositions are provided for screening, isolating and characterising endogenous and
 exogenous factors, drugs and therapeutic agents useful to evaluate and/or control cytoskeletal dynamic events involved in normal and abnormal cell morphology, adhesion, motility, growth and/or differentiation. A method of detecting a modulator of Mena activity/expression is claimed.
 Length 541;

Chemistry: Dye-primer Bodipy: 82% of reads
Chemistry: Dye-terminator Big Dye: 10% of feads
Assembly program: Phrap: version 0.990129
Consensus quality: 133377 bases at least Q40
Consensus quality: 159061 bases at least Q30
Consensus quality: 169086 bases at least Q30
Estimated insert size: 166938; sum-of-contigs estimation
Quality coverage: 2.3x in Q20 bases; sum-of-contigs estimation
 consists of 59 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
